1 Problem

Solve: Problem set: Vector2, Example-3,14

Find the lengths of the straight lines joining the pairs of points whose polar coordinates are:

$$\mathbf{P} = \left(a\ ,\ \frac{\pi}{2}\right) \text{ and } \mathbf{Q} = \left(3a\ ,\ \frac{\pi}{6}\right) \tag{1.0.1}$$

2 Solution

Let P and Q be the two points and let their polar coordinates be

$$\mathbf{P} = \left(a\ ,\ \frac{\pi}{2}\right) \text{ and } \mathbf{Q} = \left(3a\ ,\ \frac{\pi}{6}\right) \tag{2.0.1}$$

so that ,

$$OP = r_1 \tag{2.0.2}$$

$$OQ = r_2 \tag{2.0.3}$$

and angles respectively be

$$\theta_1 and \theta_2$$

$$PQ^2 = OP^2 + OQ^2 - 2 * OP * OQ * cos(POQ) \tag{2.0.4}$$

$$length = r_1^2 + r_2^2 - 2 * r_1 * r_2 * cos(\theta_1 - \theta_2) \tag{2.0.5}$$
